

PAST YEARS' QUESTIONS

Nov2012 P22

Two identical uniform rough spheres  $A$  and  $B$ , each of weight  $W$  and radius  $a$ , are at rest on a rough horizontal plane, and are not in contact with each other. A third identical sphere  $C$  rests on  $A$  and  $B$  with its centre in the same vertical plane as the centres of  $A$  and  $B$ . The line joining the centres of  $A$  and  $C$  and the line joining the centres of  $B$  and  $C$  are each inclined at an angle  $\theta$  to the vertical (see diagram). The coefficient of friction between each sphere and the plane is  $\mu$ . The coefficient of friction between  $C$  and  $A$ , and between  $C$  and  $B$ , is  $\mu'$ . The system remains in equilibrium. Show that

$$\mu \geq \frac{\sin \theta}{3(1 + \cos \theta)} \quad \text{and} \quad \mu' \geq \frac{\sin \theta}{1 + \cos \theta}. \quad [14]$$

June2010 P21

A uniform rod  $AB$  of weight  $W$  rests in equilibrium with  $A$  in contact with a rough vertical wall. The rod is in a vertical plane perpendicular to the wall, and is supported by a force of magnitude  $P$  acting at  $B$  in this vertical plane. The rod makes an angle of  $60^\circ$  with the wall, and the force makes an angle of  $30^\circ$  with the rod (see diagram). Find the value of  $P$ . [3]

Find also the set of possible values of the coefficient of friction between the rod and the wall. [4]

NOV2010

A hemispherical bowl of radius  $r$  is fixed with its rim horizontal. A thin uniform rod rests in equilibrium on the rim of the bowl with one end resting on the inner surface of the bowl at  $A$ , as shown in the diagram. The rod has length  $2a$  and weight  $W$ . The point of contact between the rod and the rim is  $B$ , and the rim has centre  $C$ . The rod is in a vertical plane containing  $C$ . The rod is inclined at  $\theta$  to the horizontal and the line  $AC$  is inclined at  $2\theta$  to the horizontal. The contacts at  $A$  and  $B$  are smooth.

In any order, show that

- (i) the contact force acting on the rod at  $A$  has magnitude  $W \tan \theta$ ,
- (ii) the contact force acting on the rod at  $B$  has magnitude  $\frac{W \cos 2\theta}{\cos \theta}$ ,
- (iii)  $2r \cos 2\theta = a \cos \theta$ .

[9]

NOV09

Two uniform rods,  $AB$  and  $BC$ , each have length  $2a$  and weight  $W$ . They are smoothly joined at  $B$ , and  $A$  is attached to a smooth fixed pivot. A light inextensible string of length  $(2\sqrt{2})a$  joins  $A$  to  $C$  so that angle  $ABC = 90^\circ$ . The system hangs in equilibrium, with  $AB$  making an angle  $\alpha$  with the vertical (see diagram). By taking moments about  $A$  for the system, or otherwise, show that  $\alpha = 18.4^\circ$ , correct to the nearest  $0.1^\circ$ . [3]

Find the tension in the string in the form  $kW$ , giving the value of  $k$  correct to 3 significant figures. [3]

Find, in terms of  $W$ , the magnitude of the force acting on the rod  $BC$  at  $B$ . [6]

June 2012

The diagram shows a uniform rod  $AB$ , of length  $4a$  and weight  $W$ , resting in equilibrium with its end  $A$  on rough horizontal ground. The rod rests at  $C$  on the surface of a smooth cylinder whose axis is horizontal. The cylinder rests on the ground and is fixed to it. The rod is in a vertical plane perpendicular to the axis of the cylinder and is inclined at an angle  $\theta$  to the horizontal, where  $\cos \theta = \frac{3}{5}$ . A particle of weight  $kW$  is attached to the rod at  $B$ . Given that  $AC = 3a$ , show that the least possible value of the coefficient of friction  $\mu$  between the rod and the ground is  $\frac{8(2k+1)}{13k+19}$ . [9]

Given that  $\mu = \frac{9}{10}$ , find the set of values of  $k$  for which equilibrium is possible. [3]
