$\therefore$  The complementary function,  $y_c$  is given by

$$\ell_2: \underline{r} = \underline{i} - 2\underline{j} + 8\underline{k} + t(\underline{1} - \underline{j} - 3\underline{k})$$

i) Since  $\ell_3$  passes through the point  $(-1, 3, 2)$  and is perpendicular to  $\ell_1$  and  $\ell_2$ , the direction of  $\ell_3$  is parallel to

$$\begin{pmatrix} -3 \\ 6 \\ 15 \end{pmatrix} \times \begin{pmatrix} 1 \\ -1 \\ -3 \end{pmatrix}$$

$$\begin{pmatrix} -3 \\ 6 \\ 15 \end{pmatrix} \times \begin{pmatrix} 1 \\ -1 \\ -3 \end{pmatrix} = \begin{vmatrix} \underline{i} & \underline{j} & \underline{k} \\ -3 & 6 & 15 \\ 1 & -1 & -3 \end{vmatrix}$$

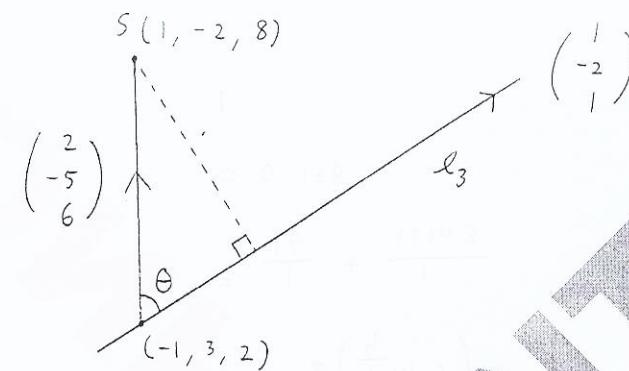

$$= -3\underline{i} + 6\underline{j} - 3\underline{k}$$

$$= -3(\underline{i} - 2\underline{j} + \underline{k})$$

$\therefore \ell_3$  has equation

$$\underline{r} = -\underline{i} + 3\underline{j} + 2\underline{k} + \lambda(\underline{i} - 2\underline{j} + \underline{k})$$

where  $\underline{n}$  is a unit vector.

i). The perpendicular distance from  $S$  to

$$l_3 \text{ is } \sqrt{11}.$$

iii) The plane which contains  $l_3$  and passes through  $P$  has normal perpendicular to the vectors  $\hat{i} - 2\hat{j} + \hat{k}$  and  $2\hat{i} - 4\hat{j} - 4\hat{k}$  since the vector are in the direction of the plane. The normal of the plane is parallel to

$$\begin{pmatrix} 1 \\ -2 \\ 1 \end{pmatrix} \times \begin{pmatrix} 2 \\ -4 \\ -4 \end{pmatrix}$$

$$\begin{pmatrix} 1 \\ -2 \\ 1 \end{pmatrix} \times \begin{pmatrix} 2 \\ -4 \\ -4 \end{pmatrix} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & -2 & 1 \\ 2 & -4 & -4 \end{vmatrix}$$

$$= \frac{\sqrt{49 + 16 + 1}}{\sqrt{1 + 4 + 1}}$$

$$= \frac{\sqrt{66}}{\sqrt{6}}$$

$$= \sqrt{11}$$

The line perpendicular to the plane and passing through S has equation

$$\underline{z} = \underline{j} - 2\underline{i} + 8\underline{k} + M(\underline{zi} + \underline{j}),$$

since it is parallel to the normal of the plane.

Since  $2\underline{i} + \underline{j}$  is the direction of the normal of the plane and

$P(1, -1, -2)$  is a point on the plane, if  $\underline{z} = \begin{pmatrix} x \\ y \\ z \end{pmatrix}$  is any point

on the plane

$$\underline{z} \cdot \begin{pmatrix} 2 \\ 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ -1 \\ -2 \end{pmatrix} \cdot \begin{pmatrix} 2 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} \cdot \begin{pmatrix} 2 \\ 1 \\ 0 \end{pmatrix} = 2x + y = 0$$

$$2x + y = 1$$

The perpendicular to the plane passing through S intersects the plane at

$$2(2M + 1) + M - 2 = 1$$

$$4M + 2 + M - 2 = 1$$

$$5M = 1$$

$$M = \frac{1}{5}$$

$$\left( \frac{7}{5}, -\frac{9}{5}, 8 \right).$$

The perpendicular distance from S to the plane which contains  $\ell_3$  and passes through P is

$$= \sqrt{\left(\frac{7}{5} - 1\right)^2 + \left(-\frac{9}{5} - 2\right)^2 + (8 - 8)^2}$$

$$= \sqrt{\left(\frac{2}{5}\right)^2 + \left(\frac{1}{5}\right)^2}$$

$$= \sqrt{\frac{4}{25} + \frac{1}{25}}$$

12. EITHER

$$C: y = \lambda x + \frac{x}{x+2}, \lambda \neq 0.$$

$$i) y = \lambda x + \frac{x+2-2}{x+2}$$

$$= \lambda x + 1 - \frac{2}{x+2}$$

As  $x \rightarrow \pm\infty$   $y \rightarrow \lambda x + 1$ As  $x \rightarrow -2$   $y \rightarrow \pm\infty$ 

The asymptotes of C are

$$y = \lambda x + 1 \text{ and } x = -2.$$

$$ii) y = \lambda x + 1 - \frac{2}{x+2}$$

$$\frac{dy}{dx} = \lambda + \frac{2}{(x+2)^2}$$

Since  $\frac{2}{(x+2)^2} > 0$ , if  $\lambda > 0$ then  $\frac{dy}{dx} > 0$  at all points of C.

iii) When  $\frac{dy}{dx} = 0$ :

$$\lambda + \frac{2}{(x+2)^2} = 0$$

$$\frac{2}{(x+2)^2} = -\lambda$$

$$(x+2)^2 = \frac{-2}{\lambda}$$

If  $\lambda < \frac{-1}{2}$ ,

$$\frac{-2}{\lambda} < 4$$

$$(x+2)^2 < 4$$

$$-2 < x+2 < 2$$

$$-4 < x < 0$$

Also, since  $\frac{-2}{\lambda} > 0$

$$x = -2 \pm \sqrt{\frac{-2}{\lambda}}$$

$\therefore$  If  $\lambda < \frac{-1}{2}$ , C has two distinct stationary points, both to the left of the y-axis.

If  $\lambda < \frac{-1}{2}$ , when  $\frac{dy}{dx} = 0$ :

$$x = -2 \pm \sqrt{\frac{-2}{\lambda}}$$

$$\frac{d^2y}{dx^2} = \frac{-4}{(x+2)^3}$$

$$\text{When } x = -2 + \sqrt{\frac{-2}{\lambda}} : \frac{d^2y}{dx^2} = \frac{-4}{\frac{-2}{\lambda} \sqrt{\frac{-2}{\lambda}}}$$

$$= 2\lambda \sqrt{\frac{-\lambda}{2}} < 0$$

$$\text{When } x = -2 - \sqrt{\frac{-2}{\lambda}} : \frac{d^2y}{dx^2} = \frac{-4}{\frac{-2}{\lambda} (-\sqrt{\frac{-2}{\lambda}})}$$

$$= -2\lambda \sqrt{\frac{-\lambda}{2}} > 0$$

$\therefore$  C has a maximum point when

$$x = -2 + \sqrt{\frac{-2}{\lambda}}$$
 and a minimum point

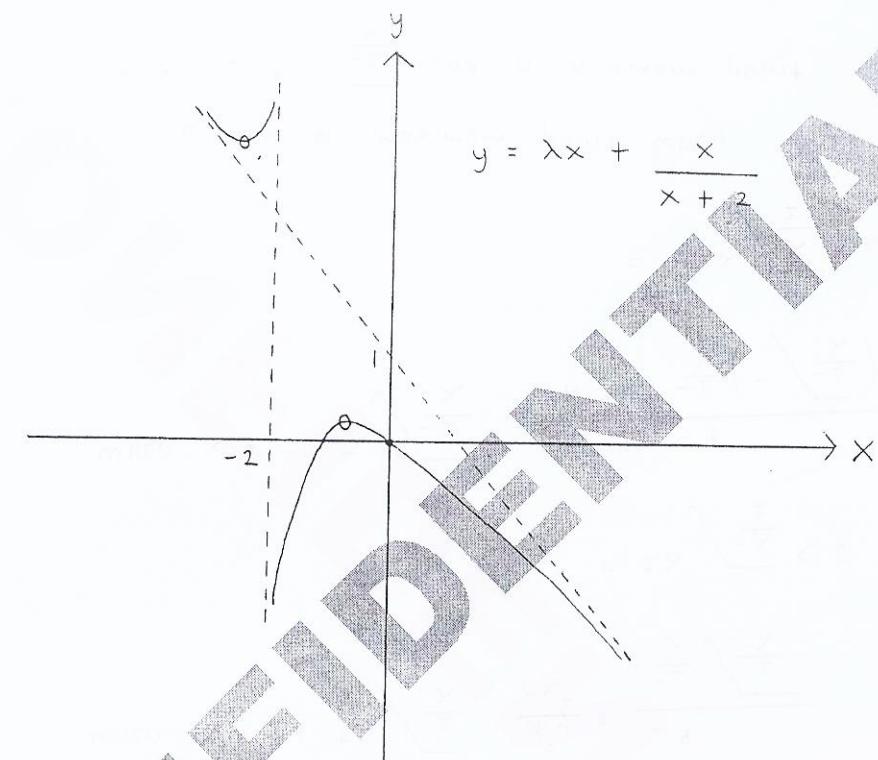

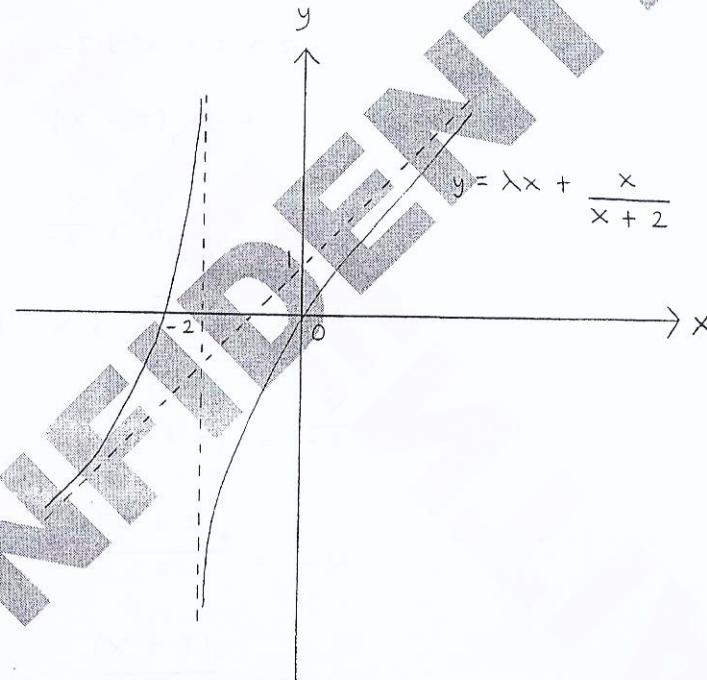

$$\text{when } x = -2 - \sqrt{\frac{-2}{\lambda}}$$

iv) The asymptotes of  $C$  are

$$y = \lambda x + 1 \text{ and } x = -2.$$

When  $x = 0$ ,  $y = 0$ .

If  $\lambda > 0$ ,  $\frac{dy}{dx} = 0$  at all points of  $C$ .
